

MINUTES OF MEETING (MOM)

AI-Based Machine Data Analysis, Testing & Reporting

Date	17 September 2026	Topic	System Development & AI Integration
Focus	Data Testing, AI Analysis, Predictions & Reporting	Prepared For	Project Development Team

Discussion Points & Action Items

Sr. No.	Action / Discussion Item	Details
1	Data Collection and Initial Testing	Collect the required data from Laxman Sir and perform initial testing on the collected data.
2	Testing of 10 Samples and Report Preparation	Test 10 samples and prepare a detailed report based on the test results.
3	Prediction from Tested Data	Perform predictions using the data obtained from the testing process.
4	AI-Based Data Analysis	Add AI-based analysis to the system to analyse the available data and generate useful insights.
5	AI Analysis Bot	Add an AI analysis bot that can provide analysis, explanations, and relevant information based on the available system data.
6	AI-Generated Summaries and Suggestions	Generate AI-based summaries and suggestions from the analysed data to make the results easier to understand and act upon.
7	Feed Section	Add a feed section to display relevant updates, information, and analysis-related content.
8	AI Input from Machine Details and Graphs	The data provided to the AI should be taken from machine details, graphs, and related analysis data so that the AI can generate summaries and provide information about parameters such as RMS, Kurtosis, and other relevant values.
9	AI Access from Left-Side Menu	Provide an AI option in the left-side menu for easy and direct access to the AI-related features.
10	Data Entry Date and Last Entry	Display the dates of data entries and clearly identify when the most recent data entry was made.
11	Separate Vibration and Noise Testing	Evaluate the system using vibration data only, and separately evaluate it using noise data only, in order to understand how the system performs for each type of data.
12	7-Day and 30-Day Summary Cards	Add card/summary views showing relevant analysis information and trends for the past 7 days and 30 days.

Overall Objective

The system is to be developed and tested with sample machine data first. The objective is to integrate AI capabilities that can analyse machine details, graphs, vibration and noise data, generate predictions, provide RMS/Kurtosis and other relevant parameter information, and present clear summaries, suggestions, historical trends, and reports through an easy-to-use interface.

Testing Approach

- Collect the required machine data and begin with 10 sample datasets.
- Test vibration data independently and record the system's performance.
- Test noise data independently and record the system's performance.
- Generate predictions and prepare the corresponding test report.
- Use machine details, graphs, and calculated parameters such as RMS and Kurtosis as inputs for AI analysis.
- Validate the AI-generated summaries, suggestions, and historical 7-day/30-day views.

Expected Outcome

A tested system with AI-assisted analysis, prediction, reporting, machine-data insights, separate vibration/noise evaluation, and historical summary views accessible through the system interface.
